Summary

Here is what's new in **Version 2024.Q1**

User friendliness

The first release of 2024 is all about user friendliness of myPARM. We listened to you as our customer and incorporated your feedback into a new home view, a new introduction to the core functionalities of myPARM and various changes in myPARM.

However, this is just the beginning and many smaller and larger changes are coming in the next few months.

New features

With a focus on user-driven upgrades, Parm AG's newest features are designed to address the evolving needs of our clientele, underscoring our commitment to staying relevant.

Did you accidentally create a project within the wrong project container or is the current project container not relevant anymore? Just drag and drop your project into another project container.

This and other new features will support your project management effortlessly.

Quality enhancements

At Parm AG, we're dedicated to delivering quality enhancements that not only streamline workflows but also enrich user experiences. With the expanded Welcome Tour and seamless timesheet integration therein, myPARM continues to evolve as a comprehensive solution tailored to meet the evolving needs of our valued users.

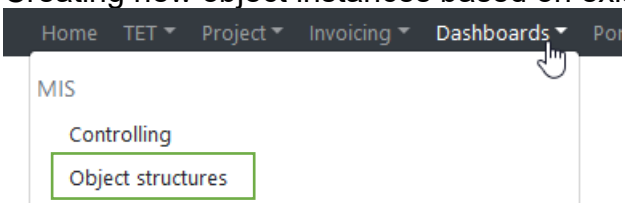

Addressing issues within the Gantt control enhances the overall usability and reliability of the feature, ensuring smoother project planning and management. Additionally, the introduction of a new report menu provides clients with easier access to vital project data and insights, facilitating informed decision-making and improving overall efficiency in project tracking and analysis.

By resolving issues and introducing new features, we aim to enhance the client's experience, streamline their workflow, and ultimately contribute to their project success.

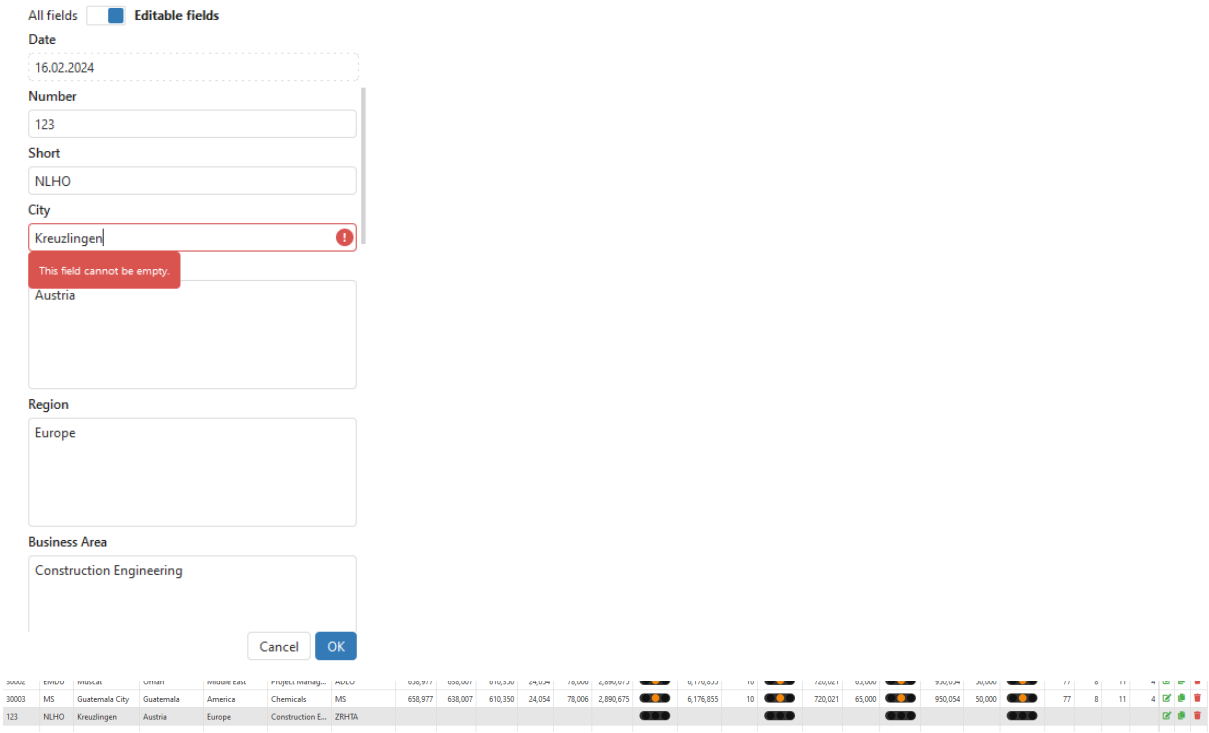

1. New features

MIS – Management Information System

Creating new object instances based on existing ones in the object structures of MIS.

On one of the last columns of a chosen object, you will now find the to copy the selected row.
When using this icon, a pop-up window opens and you have to enter the mandatory fields and the new object instance is already applicable.

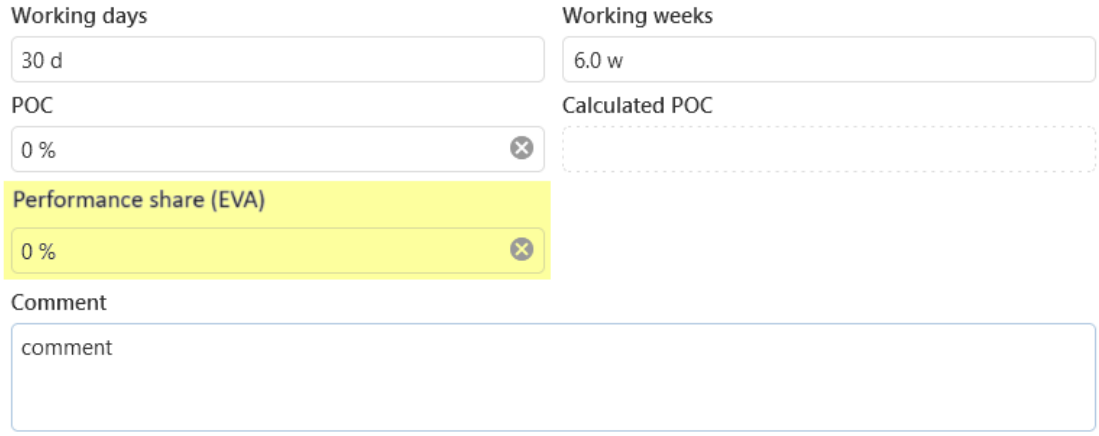

Afterwards the new object instance can be edited or deleted as usual.

Portfolio Management

In Portfolio Management, projects can now only be assigned at the lowest level in a hierarchical portfolio.
This latest addition helps prevent data inconsistencies and facilitates the generation of dashboard-ready data for deeper analysis.

EVA – Earned Value Analysis

A new field is added within the project structure for activities, called earned value analysis (EVA):

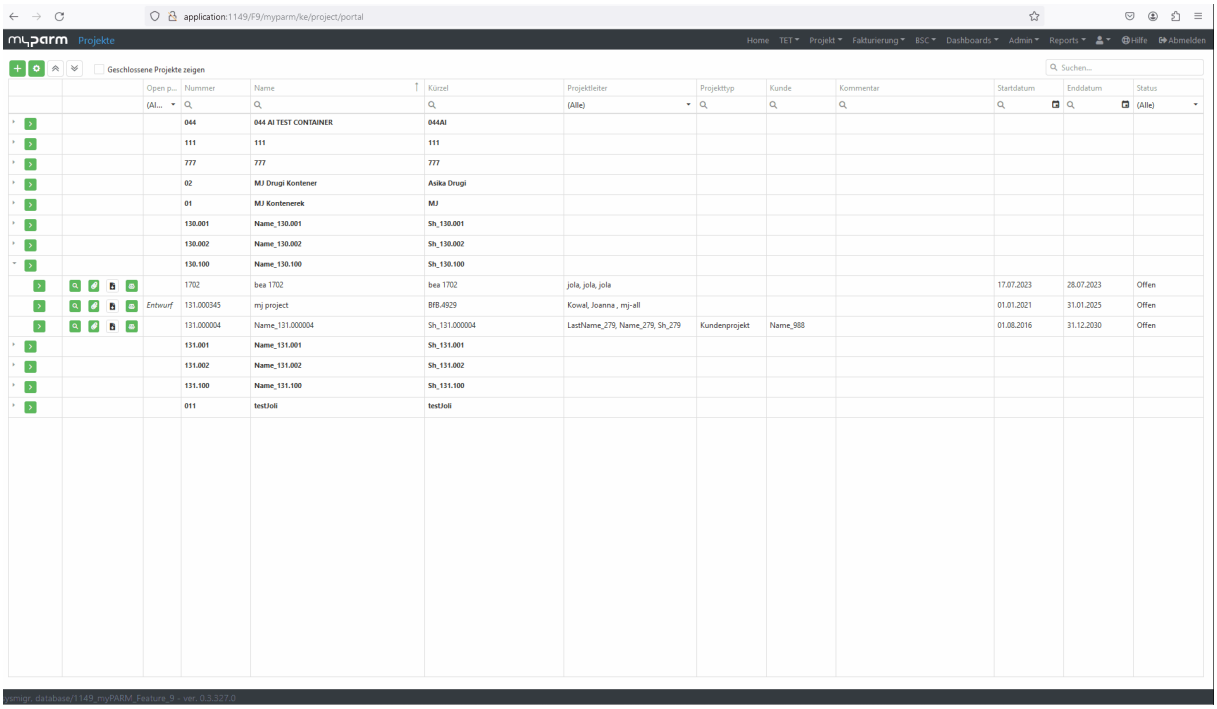

This is a percent with two decimals the corresponding activity contributes to the Earned Value when finished (e.g. 5.25%). Enables the earned value of a project to be calculated pro rata down to phases, objects, work packages or activities.

2. Quality enhancement

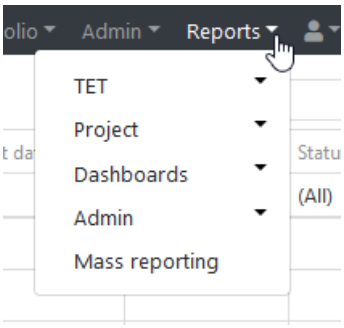

Change project container

Within the project overiew, the user has now the possibility to change project from one project container to another. The best way to do it is through project portal tree list drag&drop possibilities:

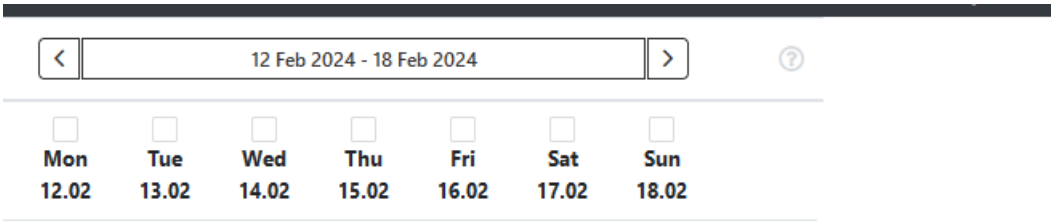

Report menu

Reports are now shown separately on the menu and are grouped in Timesheet related reports (TET), Projects, Dashboards, Admin reports and mass reporting section:

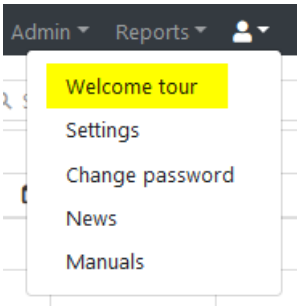

Welcome tour enhancements

After introducing our Welcome tour for new users of myPARM, we now enhanced to the timesheet. Using the little icon within the timesheet, you can always open the inscreen explanations.

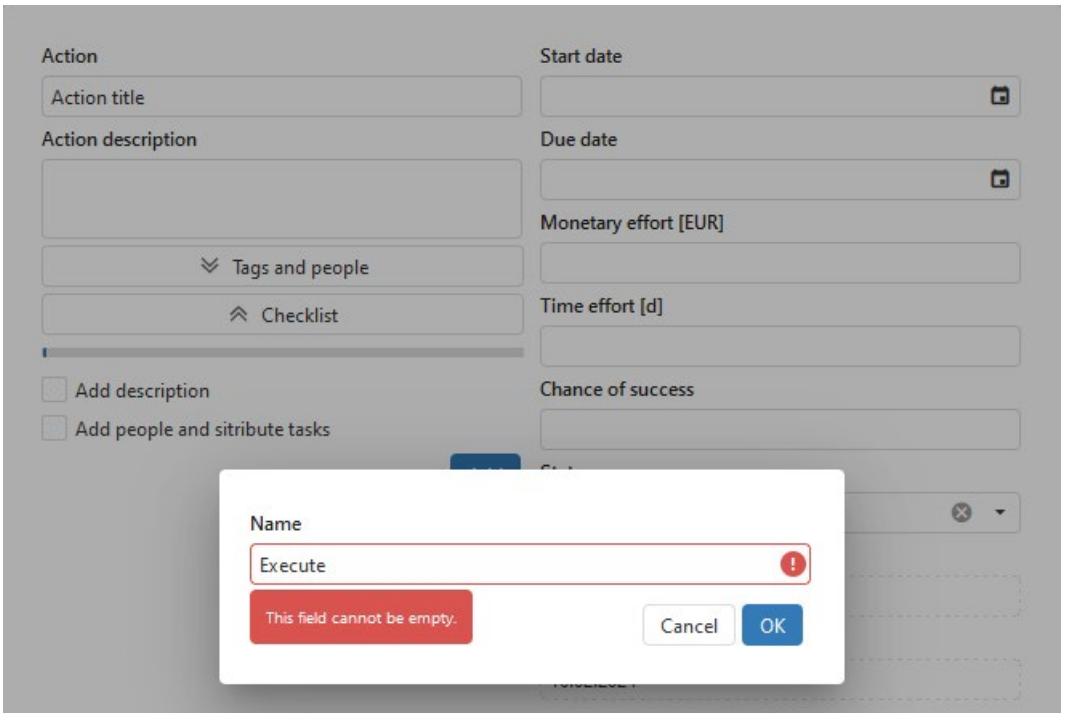

The menu items visible to the specific user will be explained in the Welcome tour for the timesheet and can be looked at any time again:

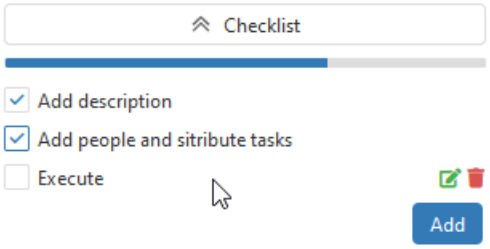

Task management – Checklist and manage tasks

Add easily checklists within all of your actions of your task management. Select checklist and add immediately the title of the item:

Once you have added the item, you can delete or edit it easily.
Further the progress bar shows the current status of items within the checklist:

Please note: While actions were only connected to projects so far, there is no limit in adding private tasks, own actions and overall non-project related tasks anymore.

3. Bugfixes

Inactive employee obstructs project team change

We came across a supporting case, where an inactive team member made a change in an ongoing process more complex than we strive to.
The solution was only visible within using the critical path, which was one click away but not ideal from our perspective. We now show the issue directly in the pop-up and attach it to the new employee who oversees the activity.
