Release Notes

2026.Q3.1

July 9, 2026

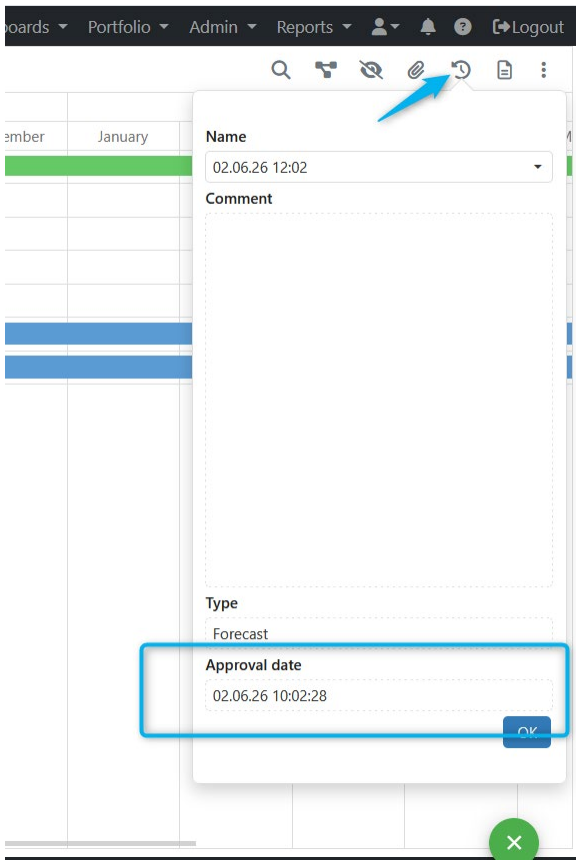

This release brings a new way to share individual logs and actions with colleagues via a direct link, new dashboard for version comparison, improved traceability of project version approvals, and administrative control over dashboard data refresh timing.

Feature Epics

Project Versioning – Approval Date Tracking

Project leaders and stakeholders now have clearer visibility into the approval history of a project's versions, making it easier to confirm exactly when a plan was signed off. This supports better traceability and audit-readiness across the project lifecycle.

myPARM now records the exact approval date for every project version. This date is displayed as a new "Approval date" column in the historical version list on the project, so users can see at a glance when each version received its final approval.

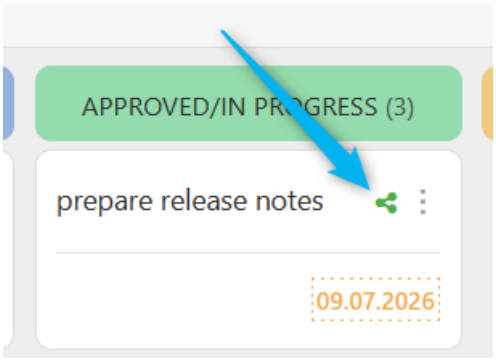

Standalone Improvements

Share Links for Logs, Actions, Measures and Comments

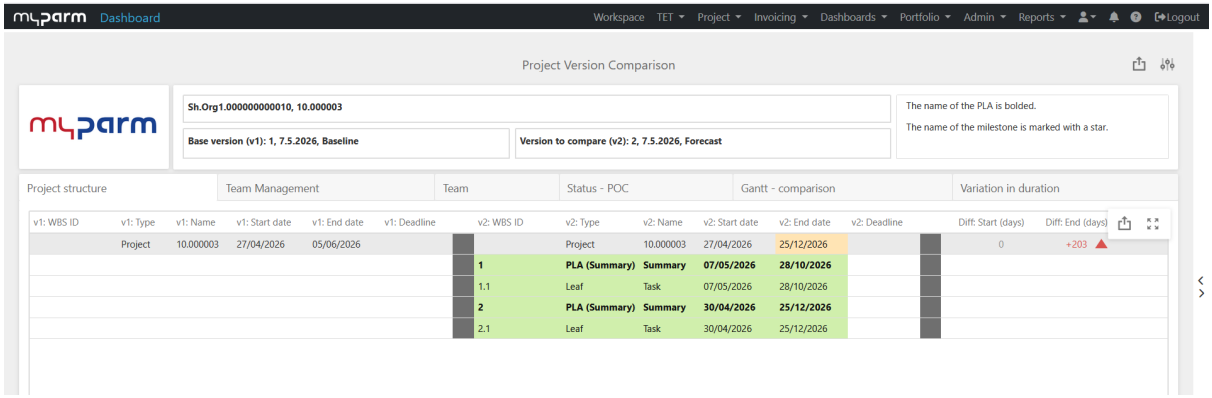

Users can now share a single risk log, quality log, action, measure, or comment with a colleague via a simple, copyable link – without giving them access to the whole project. A new Share option is available from the Kanban card menu, the grid view, and the log or action editing popup.

Recipients open the link in a focused, read-only view without needing to navigate the full application, and every share action is recorded for audit purposes.

Project Version Comparison Dashboard

A new dashboard lets project managers compare two saved versions of a project plan side by side, making it easy to see how the plan has evolved over time. It combines a visual timeline overlaying both versions with detailed comparisons of scheduling, team assignments, and progress, clearly highlighting what was added, removed, or changed.

Release Notes

2026.Q3.2

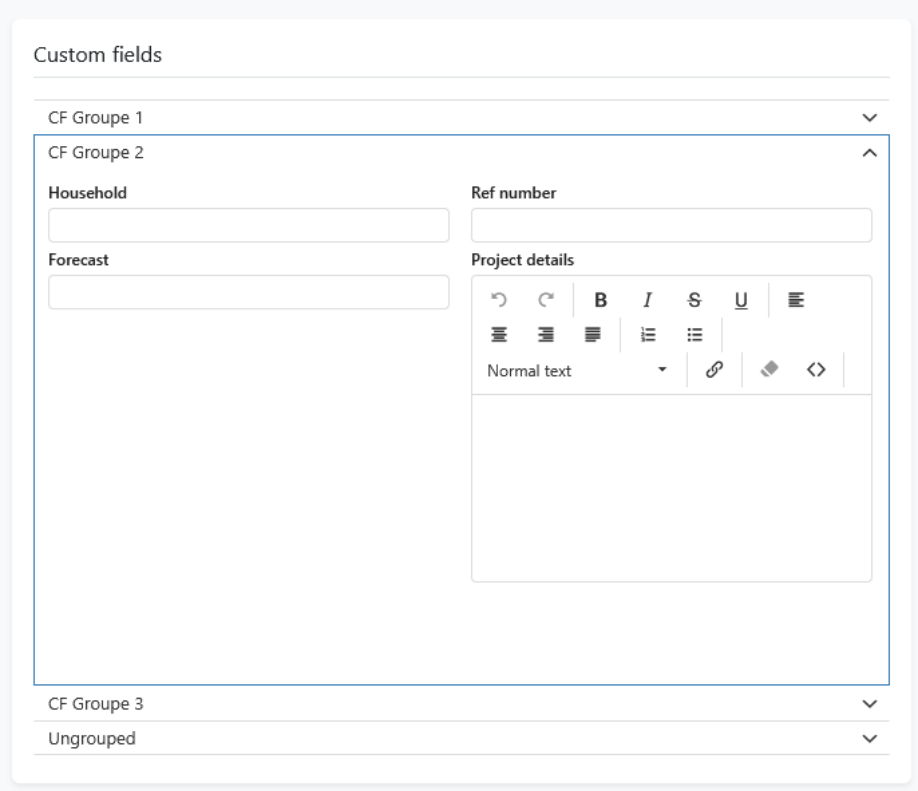

August 4, 2026

This release delivers grouped custom fields for cleaner data organization, refined total cost planning for resource management, and a modernized technical foundation built on .NET 10 and DevExpress 26.1, alongside a number of smaller usability improvements described below.

Feature Epics

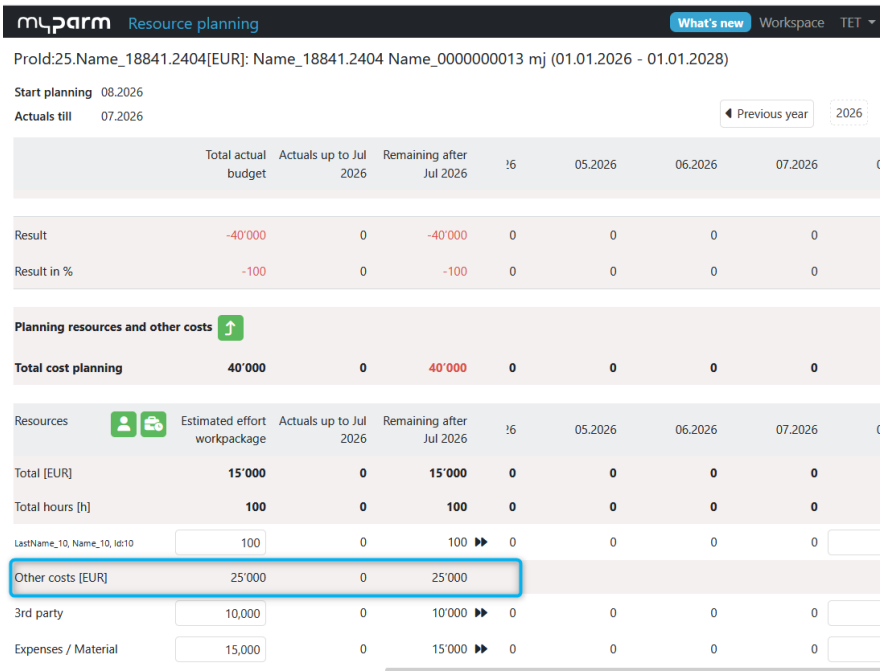

Custom Fields – Grouping

As projects accumulate more and more custom fields, keeping them organized and easy to navigate becomes a challenge. This release introduces the ability to group related custom fields together, so they can be defined, displayed, and managed as logical clusters rather than one long list. Administrators can now define field groups, and end users see custom fields presented in these grouped views wherever they appear — making forms easier to read and information faster to find.

Resource Management – Total Cost Planning Enhancements

Accurate financial oversight is essential for effective resource planning. This release refines how total cost planning is calculated, giving project and resource managers more reliable figures to work with. A new summary row for other costs has also been added, making it easier to see the full cost picture at a glance, with the updated calculations integrated consistently across the relevant views.

Platform Modernization: .NET 10 & DevExpress 26.1

Behind the scenes, myPARM's core technology has been upgraded to run on .NET 10 and the DevExpress 26.1 component suite. This modernization keeps the platform on current, well-supported foundations, improving long-term performance, security, and reliability. The upgrade spans myPARM's core services, APIs, mobile app, and synchronization tools.

Additional Improvements

New Rich Text Field Type for Custom Fields

Text-based custom fields can now be configured as rich text, allowing formatted content — such as bold text and bullet lists — instead of plain text. The new option is available consistently across project, activity, HR, and contract custom field panels, as well as in MIS reporting views.

Risk Log – New “Issue” Type

The Risk/Opportunity classification in the Risk Log has been extended with a third option, “Issue,” and the field has been renamed simply to “Type.” This gives teams a clear way to track issues alongside risks and opportunities within the same log.

Configurable Visibility for TET Restrictions

A new administrative setting allows organizations that don't use TET restrictions to hide the TET restrictions panel entirely from project attributes and Gantt activity views, simplifying the interface for clients who don't need it.

Faster Navigation: Open Menu Items in a New Tab

Clickable menu items can now be opened in a new browser tab with a middle mouse click, making it quicker to navigate between workspaces, reports, and dashboards without losing your place.

Automated Audit Trail for Quality Log Changes

When the system automatically updates a Quality log linked to a Milestone or Gate activity — for example, changing its status or planned date ahead of a gate date — it now records a clear audit comment describing what changed, attributed to "Automation." This gives teams full traceability between automatic and manual updates.

Thank you for using myPARM. As always, we welcome your feedback on these improvements.

Release Notes

2026.Q3.3

August 25, 2026

This release focuses on refining invoicing for international customers and continuing usability upgrades introduced in earlier releases.

Feature Epics

Invoicing – Extras Ordering & EU Invoice Details

This release improves the invoicing experience for international customers. A new "Additional Information for EU invoices" field on customer contracts lets teams capture invoice-specific details once and have them carried automatically into the profit and loss account (PLA), reducing manual re-entry and keeping EU invoices consistent.

Custom Fields – Grouping Refinements

Building on the custom field grouping improvements introduced previously for project and idea attributes, this release extends the same compact, easy-to-scan group headers to the project readonly view and the project structure view, giving users a consistent, space-efficient layout for browsing custom field groups everywhere they appear.

Standalone Improvements

Simplified Date Format Options

To avoid confusion when reading dates, the ambiguous "dd.MM.yy" date format has been removed from the system-wide date format setting. Only the unambiguous dd.MM.yyyy, MM.dd.yyyy, and yyyy.MM.dd formats remain, and any environment previously using the old format has been automatically switched to dd.MM.yyyy.

Beyond the items above, this release also delivers a number of smaller layout and usability improvements across the application, further refining consistency and ease of use in everyday work.

Release Notes

2026.Q3.4

September 9, 2026

This release brings a more flexible Gantt scheduling experience, a redesigned project overview dashboard, a new project-sizing assessment tool, and a set of usability improvements across custom fields and contract management.

Feature Epics

Gantt Dependency Adjustments

Managing task dependencies in the Gantt chart is now more flexible and less prone to being blocked by overly rigid validation rules. Previously, an underlying third-party control enforced strict dependency checks that could prevent legitimate scheduling adjustments; this validation has now been relaxed for both manual date edits and drag-and-drop changes made directly in the Gantt view. As part of this work, the same relaxed validation was also extended to task templates, so schedules built from templates behave consistently with regular projects. Together these changes give project managers more freedom to reflect real-world scheduling situations without fighting the tool, while circular dependencies remain blocked to protect data integrity.

Standalone Improvements

Larger Editing Window for Rich Text Custom Fields

Rich text custom fields can now be expanded into a full-size popup window for editing, making it much easier to work with longer or more detailed content than the inline field previously allowed. The expanded view is also available when viewing read-only records.

Configurable Custom Field Column Layout

A new setting lets administrators control how many custom fields are shown before the layout switches from a single column to two columns, or turns the split off entirely. This keeps custom field forms readable regardless of how many fields a given object has configured.

Longer Text in TextBox Custom Fields

TextBox custom fields will support significantly longer content, with a new default maximum of 4,000 characters and an optional unlimited-length mode, up from today's 999-character limit.

Thank you for using myPARM. For questions about this release, please contact your Parm AG representative.

Release Notes

2026.Q3.5

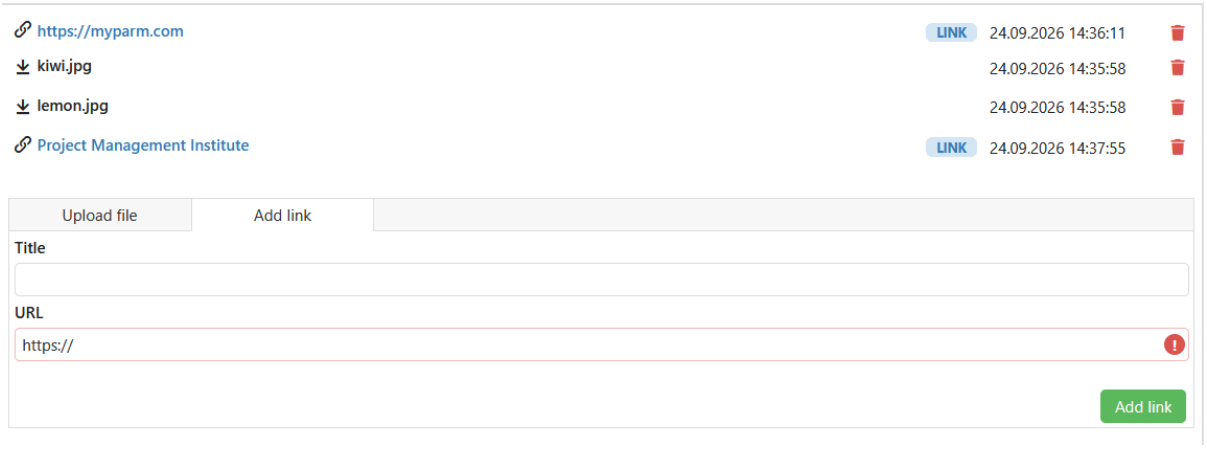

September 25, 2026

This release introduces web links on log entries across all major modules, more flexible selection of workflow variants, and a set of usability improvements for custom fields and keyboard navigation.

Feature Epics

Links on Logs

Log entries are where teams record decisions, status updates and follow-up actions, yet the supporting information often lives in other systems. In addition to attaching documents, users can now add web links directly to individual log entries, so related tickets, shared folders, intranet pages or external references are only one click away. Links are supported on activity logs (in the project structure editor, the read-only project view and historical versions), Home portal logs, Balanced Scorecard logs, dashboard logs, MIS object instance logs, and contract logs. Each link belongs to the specific log entry it was added to and appears in the list as soon as it is saved, without the need to reopen the window. Managing links follows the access rights already in place in each module: users with full access can add and remove links, while users with read-only access, such as observers on Home portal logs, can open existing links but not change them.

Standalone Improvements

Flexible Variant Selection in Workflows

Workflow definitions now include an "Allow selection of variants" option that determines at which step a process variant can be chosen. This gives organisations more flexibility, for example to capture a simple idea first and decide on the appropriate process variant only when the idea is promoted to a project. Once selected, the variant is saved on the object and

applied consistently to all subsequent workflows included in it. If a variant contains no workflow that allows selection, a warning is shown so that configuration gaps are easy to spot.

Collapsible Custom Field Groups in Project Attributes

Grouped custom field panels in project attributes can now be fully collapsed and expanded, consistent with the behaviour in activity attributes. This makes longer attribute forms easier to navigate and lets users focus on the groups that matter to them.

Group Column in the Custom Fields List

The custom fields list in Administration now includes a Group column showing which group each field belongs to, making it easier to review and maintain how fields are organised. The column is shown only when custom field groups are defined.

Wider Custom Fields Panel

A new setting allows the custom fields panel in project attributes to be displayed at double width, even when the fields are shown in a single column. This gives longer field values more room and improves readability.

Keyboard Shortcut Improvements

Keyboard handling has been improved across the application. Text can be selected word by word or character by character using Ctrl+Shift or Shift with the arrow keys, Ctrl+Shift+S saves, Ctrl+Shift+Y adds a new entry, and Ctrl with the left or right arrow shows or hides the details panel in views such as the schedule.
